the origin is one of the most important books ever published and a knowledge of it should be a part of the intellectual equipment of every educated person the book will endure in future ages so long as a knowledge of science persists among mankind nature it took charles darwin more than twenty years to publish this book in part because he realized that it would ignite a firestorm of controversy on the origin of species first appeared in 1859 and it remains a continuing source of conflict to this day even among those who

reject its ideas however the work s impact is undeniable in science philosophy and theology this is a book that changed the world in addition to its status as the focus of a dramatic turning point in scientific thought on the origin of species stands as a remarkably readable study carefully reasoned and well documented in its arguments the work offers coherent views of natural selection adaptation the struggle for existence survival of the fittest and other concepts that form the foundation of modern evolutionary theory

introduction when on board h m s beagle as naturalist i was much struck with certain facts in the distribution of the inhabitants of south america and in the geological relations of the present to the past inhabitants of that continent these facts seemed to me to throw some light on the origin of species that mystery of mysteries as it has been called by one of our greatest philosophers on my return home it occurred to me in 1837 that something might perhaps be made out on this question by patiently accumulating and reflecting on all sorts of facts which could possibly have any bearing on it after five years work i allowed myself to speculate on the subject and drew up some short notes these i enlarged in 1844 into a sketch of the conclusions which then seemed to me probable from that period to the present day i have steadily pursued the same object i hope that i may be excused for entering on these personal details as i give them to show that i have not been hasty in coming to a decision my work is now nearly finished but as it will take me two or three more years to complete it and as my health is far from strong i have been urged to publish this abstract i have more especially been induced to do this as mr wallace who is now studying the natural history of the malay archipelago has arrived at almost exactly the same general conclusions that i have on the origin of species last year he sent to me a memoir on this subject with a request that i would forward it to sir charles lyell who sent it to the linnean society and it is published in the third volume of the journal of that society sir c lyell and dr hooker who both knew of my work the latter having read my sketch of 1844 honoured me by thinking it advisable to publish with mr wallace s excellent memoir some brief extracts from my manuscripts i much regret that want of space prevents

my having the satisfaction of acknowledging the generous assistance which i have received from very many naturalists some of them personally unknown to me i cannot however let this opportunity pass without expressing my deep obligations to dr hooker who for the last fifteen years has aided me in every possible way by his large stores of knowledge and his excellent judgment in considering the origin of species it is quite conceivable that a naturalist reflecting on the mutual affinities of organic beings on their embryological relations their geographical distribution geological succession and other such facts might come to the conclusion that each species had not been independently created but had descended like varieties from other species nevertheless such a conclusion even if well founded would be unsatisfactory until it could be shown how the innumerable species inhabiting this world have been modified so as to acquire that perfection of structure and coadaptation which most justly excites our admiration naturalists continually refer to external conditions such as climate food etc as the only possible cause of variation in one very limited sense as we shall hereafter see this may be true but it is preposterous to attribute to mere external conditions the structure for instance of the woodpecker with its feet tail beak and tongue so admirably adapted to catch insects under the bark of trees in the case of the misseltoe which draws its nourishment from certain trees which has seeds that must be transported by certain birds and which has flowers with separate sexes absolutely requiring the agency of certain insects to bring pollen from one flower to the other it is equally preposterous to account for the structure of this parasite with its relations to several distinct organic beings by the effects of external conditions or of habit or of the volition of the plant itself the author of the vestiges of creation would i presume say that after a certain unknown number of generations some bird had given birth to a woodpecker and some plant to the misseltoe and that these had been produced perfect as we now see them but this assumption seems to me to be no explanation for it leaves the case of the coadaptations of organic beings to each other and to their physical conditions of life untouched and unexplained

charles darwin's *On the Origin of Species by Means of Natural Selection* is both a key scientific work of research still read by scientists and a readable narrative that has had a cultural impact unmatched by any other scientific text first published in 1859 it has continued to sell to be reviewed and discussed attacked and defended the origin is one of those books whose controversial reputation ensures that many who have never read it nevertheless have an opinion about it jim endersby's major scholarly edition debunks some of the myths that surround darwin's book while providing a detailed examination of the contexts within which it was originally written published and read endersby provides a very readable introduction to this classic text and a level of scholarly apparatus explanatory notes bibliography and appendixes that is unmatched by any other edition

*On the Origin of Species* published on 24 november 1859 is a work of scientific literature by charles darwin which is considered to be the foundation of evolutionary biology its full title was *On the Origin of Species by Means of Natural Selection or the Preservation of Favoured Races in the Struggle for Life* for the sixth edition of 1872 the short title was changed to *The Origin of Species* darwin's book introduced the scientific theory that populations evolve over the course of generations through a process of natural selection it presented a body of evidence that the diversity of life arose by common descent through a branching pattern of evolution darwin included evidence that he had gathered on the beagle expedition in the 1830s and his subsequent findings from research correspondence and experimentation
